

HTML & Web Development — Detailed Notes

1. HTML Elements kya hote hain?

- **Definition:** Webpage ke upar koi bhi cheez (heading, paragraph, button, image) display karne ke liye hum **HTML Elements** create karte hain.
- **Standard Components:** Ye wo standard elements hote hain jinhe browser (jaise Chrome) samajhta hai ki page par kahan aur kya render karna hai.
- **Structure:** Ek pura HTML element teen cheezon se milkar banta hai:
 - **Opening Tag:** Jahan se element start hota hai.
 - **Content:** Jo actual information ya text display hona hai.
 - **Closing Tag:** Jahan element band hota hai (with forward slash `/`).

2. HTML Tags as Containers

- **Container Concept:** Tags ek container ki tarah kaam karte hain jo content ko apne andar hold karte hain.
- **Angular Brackets:** Tags hamesha `<` aur `>` ke beech likhe jaate hain.
- **Closing Slash:** Closing tag me `/` aana compulsory hota hai taaki browser ko pata chale ki element yahan khatam ho gaya.

⚡— Paragraph Tag Example —→
`<p>ABCD</p>`

⚡— Large Heading Example —→
`<h1>Heading Large</h1>`

3. Major Tags Covered in Lesson

- `<p> ... </p>` — Normal text paragraph dikhane ke liye.
- `<h1> ... </h1>` — Badi heading ke liye. HTML me headings ke total **6 levels** hote hain (h1 se h6).
- `<b> ... </b>` — Kisi specific word ya text ko bold/highlight karne ke liye.
- **Italics & Underline:** Text formatting ke liye use hote hain.

Key Rule: In tags ko alag se ratne ki bilkul zaroorat nahi hai. Ye bahut simple aur intuitive hain, practice ke dauran naturally yaad ho jaate hain.
